

Vladislav Laikov

Senior Backend Engineer · PHP / Symfony · 7+ years · high-load, architecture & any complex domain

{ Profile }

Senior backend engineer who builds, scales, and **owns** the systems businesses depend on — **7+ years** in **PHP / Symfony** across SaaS, FinTech, healthcare and web platforms. Deep where it counts, and **adaptable by default**: shipped across **PHP 5.6 → 8.5**, **Symfony 3.4 → 7.4** and **Laravel 6 → 10**, with PostgreSQL, MySQL, MongoDB and MySQL → PostgreSQL migrations. Strong in **scalable architecture**, **high-load systems**, REST APIs, DDD/SOLID, database performance and testing. Most recently leading backend work on the **systeme.io** platform — microservice architecture, multiple payment-provider integrations, **~50 TB** of data. I'm **domain-agnostic by choice** and open to remote roles worldwide — the constant isn't the domain, it's how I work: ownership end-to-end.

Senior Backend Engineer (PHP/Symfony) @ **systeme.io**

APR 2024 — PRESENT · REMOTE

SaaS for online business · ~50 TB data · 12+ payment providers · Microservices

- Own **all 12+ payment integrations** on a SaaS processing **~50 TB**; implemented **ApplePay via Stripe** end-to-end, opening mobile checkout for US/EU markets — **a pattern reusable beyond payments**.
- Decomposed **Flutterwave** from the monolith into a **standalone microservice**; designed a **partial-refund engine** with multi-provider webhook orchestration via **Chain of Responsibility**, eliminating a whole class of lost-refund bugs.
- Led a **PostgreSQL 14 → 18** upgrade across the monolith cluster via **zero-downtime logical replication**; drove **PHP 8.3 → 8.5** and **Symfony 6.4 → 7.4 LTS** migrations.
- Together with the payments team**, cut hot-path query latency by **3x**: full epic cycle — design, task split between two engineers, implementation and acceptance. Slow-query profiling, targeted indexing, **Doctrine ORM** batch processing.
- Ran every major initiative **iteratively and aligned with team and stakeholders** — from planning and architecture review through release and post-deploy monitoring.

PHP 8.5 Symfony 7 PostgreSQL 18 MongoDB Redis AWS Docker RabbitMQ

Kafka Grafana Loki

Backend Engineer (PHP) @ **Octopays (Mservis)**

MAR 2023 — MAR 2024 · REMOTE

Fintech CORE team · 2 TB+ production DB · Real-time transactions

- Core engineer on a high-load fintech platform with a **2 TB+ production DB** and real-time transaction processing.
- Ran **PHP 7.4 → 8.2** and **Laravel 9 → 10** migrations; refactored critical payment pipelines for type-safety and performance.
- Architecture optimization: bottleneck profiling, query tuning, **Redis** caching; full **PHPUnit** coverage, **PHPStan** static analysis, observability on **ELK**.
- Contributed to a **MySQL → PostgreSQL migration** on a critical platform contour: schema redesign for PostgreSQL-specific indexes and types, **phased data migration with full integrity**, legacy-code adaptation to the new dialect, and production validation.

Backend Engineer (PHP) @ Basis33 APR 2020 – MAR 2023 · REMOTE

Team of 25 engineers · DeinArzt medical platform · Fsexpert (Zoom API)

- Shipped **DeinArzt** (medical) and **Fsexpert** (consultations) — **two very different domains**, both delivered to production. DeinArzt: a German medical platform with strict compliance (2 years of development); Fsexpert: a consultation service with **Zoom API** integration.
- Coordinated cross-functional work in a **25-engineer team**; owned SQL optimization and **replication & partitioning** of the production cluster.

PHP 7.4 Symfony 5.3 API Platform MySQL RabbitMQ Docker GitLab CI/CD

Backend Engineer (PHP) @ Sollento Group FEB 2019 – MAR 2020 · REMOTE

SPA classifieds + scraper · SOA architecture

- Built a **REST API from scratch**, designed the backend architecture on **PostgreSQL**, set up a full **CI/CD** pipeline on GitLab.
- Created an automated **web scraper** for listing aggregation; structured the codebase as **SOA** following SOLID and GRASP principles.

PHP Symfony Doctrine PostgreSQL Docker Swagger

{ Highlights }

ApplePay via Stripe systeme.io

Built an end-to-end **ApplePay** integration via Stripe, opening **mobile checkout** for US/EU markets on a **~50 TB** SaaS platform.

Microservice decomposition flutterwave

Extracted **Flutterwave** from the monolith into a standalone **microservice** with its own deploy, queue and observability stack.

PostgreSQL 14 → 18 upgrade zero-downtime

Upgraded the monolith's **PostgreSQL 14** → **18** cluster via **logical replication** — no maintenance window, no production incidents.

Partial-refund engine 12+ providers

Designed a **multi-provider** partial-refund system orchestrating webhooks via **Chain of Responsibility**, eliminating a whole class of lost-refund bugs.
